

Data Migration 101

Getting started with Members & Companies

Dana Alvarenga
March 2026

Key Learning:

Every Member record must connect to a Company and have a unique email. Before loading data, define any custom dynamic fields and the allowed values for those fields that are required for accurate data migration.

What Data Are You Migrating?

A basic SlapFive migration usually loads two core objects

In SlapFive, we refer to Members who are your contacts, and Companies, who are the accounts they roll up to.

Members:

The individuals who will exist in SlapFive

Companies:

The organizations those Members belong to

Defining SlapFive Status Field Values

Understanding Program Status and Active Status

Active/Inactive Status

This is typically used to classify between an active advocate in the program or an active customer within that client database. Prior to uploading Member and Company data, the meaning of Active and Inactive status need to be defined.

Member & Company Program Status

Recommended definitions (client-defined):

- **Member** – Company or Member are active advocates in the program available for acts of advocacy
- **Targeted** – potential advocates identified by CMA team for recruiting
- **Invited** – targets invited 1:1 or 1:Many to formally participate in program (usually follows Nominated status)
- **Nominated** – nominated by Sales or CS from CRM contact record or dedicated form as potential advocate for CMA outreach
- **Former Member** – no longer an advocate by choice or terminated by the customer marketing team for inactivity, or because customer is at-risk/churned

Required Data Model Fields

If a required field value is blank, record is not ready to migrate

Object	Required Fields	Notes
Member	1. First Name 2. Last Name 3. Email 4. Company 5. Program Status 6. Active Status	Each member must have values in at least these six fields. Company value on Member records should match the value on the Company the Member belongs to. Status value can be Inactive or Active and Program Status value can be Member, Invited, Targeted, or Nominated
Company	1. SFDC Account ID 2. Program Status 3. Active Status	This is the unique identifier for the Company (Account) from Salesforce. Use the exact Account ID used in SFDC. Status value can be Inactive or Active and Program Status value can be Member, Invited, Targeted, or Nominated

Recommended Data Model Fields

If a required field value is blank, record is not ready to migrate

Object	Required Fields	Notes
Member	1. Activities Willing To Do 2. LinkedIn URL 3. Title 4. Trusted Contact	Activities Willing To Do reflect the known willingness of advocates to participate in the universe of total activities offered. LinkedIn URL enables Job Change Tracker. Trusted Contact can be a CMA or Account Team contact
Company	1. Company Permissions 2. Company Description 3. CSM or Account Owner 4. Products Owned	Company Permissions reflect known PR approvals. Company Description will show on SlapFive Boards. CSM or Account Owner are valuable when building workflow automations. A dynamic field is recommended to track Products Owned

Important Dynamic Field Decisions

Defining field types and allowed values to accommodate your data

- **Object:** Does the field belong on the Member or Company record?
- **Field Name:** What is the field called in its original source?
(*Spreadsheet, SFDC, net-new field*)
- **Field Type:** What kind of input does the field accept?
- **Allowed Values:** Dependent on the Field Type listed above

Field Type

How To Use It

Pick One	When the user should select one option only, such as Region or Customer Tier
Pick Many	When multiple values may apply, such as Products Used or Reference Activities
Yes / No	For true/false answers, such as CAB Member or Willing to Provide Referral
Text	For short freeform entries, such as Job Title or Nickname
Long Text	For longer notes, descriptions, or comments that need more room

Biggest Mistakes To Avoid

Clean data uploads make for SlapFive success

- **Using inconsistent company names.** For instance, if one file says “Acme” and another says “Acme, Inc.”, matching becomes messy. This is where using SFDC account ID and deduping data prior to migration are important.
- **Loading dynamic fields** before agreeing on final field names and values.
- **Using freeform text** when a controlled picklist would be cleaner and easier for reporting.
- **Leaving required fields blank** or using duplicate email addresses for Members.
- **Using the wrong SFDC Account ID** or a partial ID instead of the exact 18 digit value from Salesforce.

Recommended Pre-Migration Checklist

Start your SlapFive instance off on the right data footing

Done?	Checklist Item
	Confirm every Member has a first name, last name, email, and Company
	Confirm every Company has the correct SFDC Account ID
	Standardize Company naming so records match cleanly
	List every dynamic field needed for go-live
	Choose the correct field type for each dynamic field
	Document the allowed values for every pick one and pick many field
	Remove duplicates and blank rows from source files
	Do a final review with business and technical owners before import
